General Description

Overview

The MtW8153 is a fully integrated single chip, triple receiver - dual Transmitter radio frequency integrated circuit (RFIC) designed to support the emerging IEEE 802.11n WLAN standard for MIMO applications. It operates in the 4.9 GHz to 5.9 GHz World Band frequency range (802.11a/n). That is making it compatible with both the new 802.11n and legacy 802.11a standards. By implementing real MIMO technology, the MtW8153 supports Phy rates in excess of 300Mbps and two to eight times extended reach. Additionally, MtW8153 offers true performance scalability to support higher rates and significantly better cost efficiency as compared to multiple-device MIMO RF solutions.

MtW8153 features all the necessary circuitry to form 2x3 MIMO radio frequency (RF) transceiver matrix: Three full receive paths and two full transmit paths, phase locked loop (PLL) synthesizer, receiver and transmitter gain control, receive signal strength indicator (RSSI) and loopback paths for calibration.

MtW8153 employs a Zero-IF, direct-conversion architecture, eliminating the need for external SAW filters by implementing on-chip, tunable baseband filtering. The RSSI enables accurate automatic gain control (AGC) setting as well as best-in-class rejection of interferers.

MtW8153 is fabricated in a mature Silicon Germanium (SiGe) process packed in an 10 x 10 x1 mm, 0.4mm pitch QFN Package (QFN88), and uses a single operating voltage.
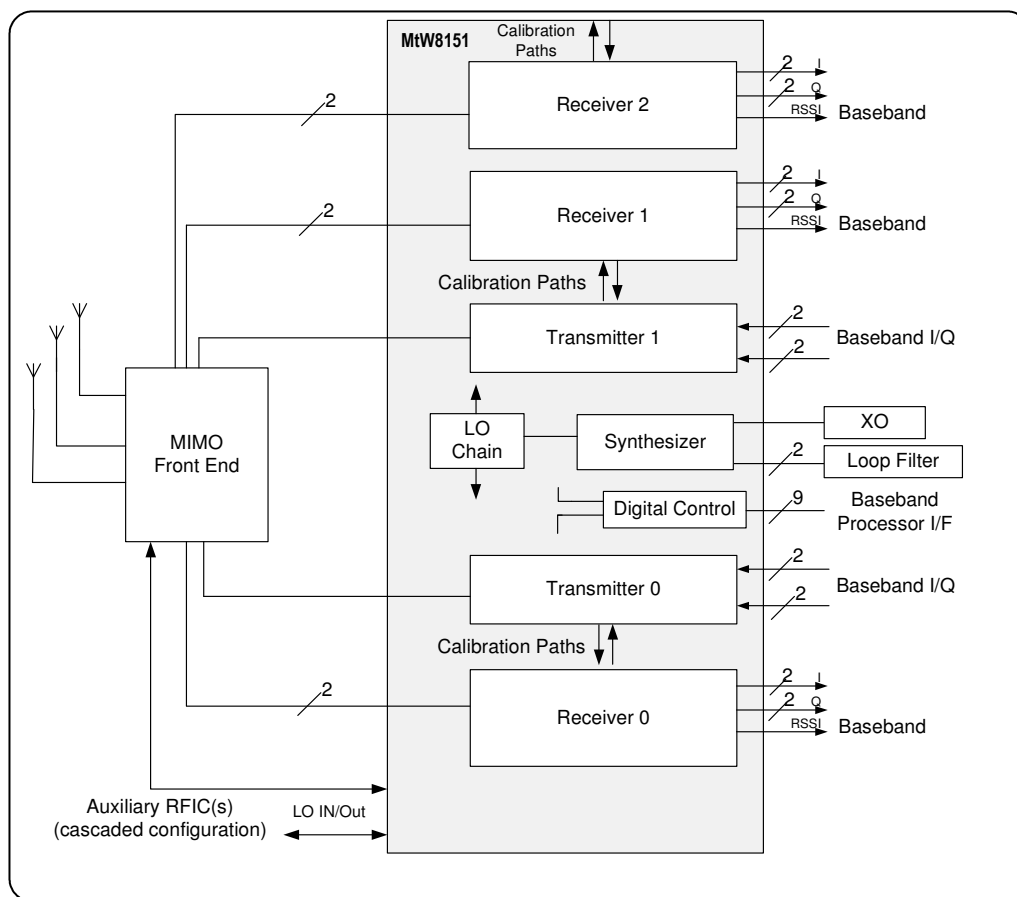

Figure 1: Functional Block Diagram

Key Features

- 2 x 3 real MIMO RFIC for WLAN in a single state-of-the-art chip

- Best-in-class spectrum utilization: two independent data chains enable using spatial multiplexing to receive and transmit separate data streams over the same frequency channel

- 4.9 GHz to 5.9 GHz World-Band operation

- Supports Phy rates in excess of 300Mbps

- Channel bonding: supports both 20MHz channels and 40MHz bonded channels for extended throughput.

- Supports Smart-Antenna techniques such as SDMA (beamforming), STBC, diversity, antenna loading

- Tunable baseband filtering in the receiver

- Receive signal strength indicator (RSSI) enables fast and accurate automatic gain control (AGC) settings and improved interferer rejection

- Fast switching between receive and transmit modes

- Single operating voltage

- 10 x 10 x 1 mm, 0.4mm pitch QFN88 package

- Compliant with IEEE 802.11n and IEEE 802.11a standards

- Supports BPSK, QPSK, 16-QAM and 64-QAM OFDM

- On-chip integrated synthesizer and VCO

- Fast and simple digital control parallel interface

- Zero-IF direct conversion: No external SAW filters required

- Integrated loopback paths for Tx/Rx calibration

- Separate controls for each RF chain

- Mature SiGe process

1 Pinout Descriptions

Top pins (88 to 67):
GND(88), GND(87), RX0RF5GN(86), RX0RF5GP(85), GND(84), VDD_TX0DRV(83), VDD_TX0_TPC(82), TX0RF5G(81), VDD_MIX1(80), VDD_LNA1(79), GND(78), RX1RF5GN(77), RX1RF5GP(76), GND(75), TX1RF5G(74), VDD_TX1_TPC(73), VDD_TX1DRV(72), GND(71), RX2RF5GP(70), RX2RF5GN(69), VDD_LNA2(68), GND(67)

Left pins (1 to 22):
GND(1), VDD_LNA0(2), VDD_MIX0(3), TX0BBQP(4), TX0BBQN(5), TX0BBIP(6), TX0BBIN(7), VDD_TX0_BB(8), VDD_RSSI1(9), RSSI1(10), VDD_RSSI0(11), RSSI0(12), RF_TD0(13), RF_TD1(14), RF_TD2(15), RF_TD(16), VDD_RX0_BB(17), LD(18), GND(19), GND(20), GND(21), GND(22)

Right pins (66 to 45):
VDD_MIX2(66), TX1BBQP(65), TX1BBQN(64), TX1BBIP(63), TX1BBIN(62), VDD_TX1_BB(61), RSSI2(60), VDD_RSSI2(59), VDDDIG(58), VDDDIG_IO(57), RESET(56), DATA5(55), DATA4(54), DATA3(53), DATA2(52), DATA1(51), DATA0(50), STRB(49), CS(48), WRITE(47), VDD_RX2_BB(46), GND(45)

Bottom pins (23 to 44):
RX0BBQP(23), RX0BBQN(24), RX0BBIP(25), RX0BBIN(26), VDD_RX1_BB(27), RX1BBQP(28), RX1BBQN(29), RX1BBIP(30), RX1BBIN(31), VDD_LO(32), VDD_VCO(33), Vreg_VCO(34), VDD_VCOIO(35), VCO_IO(36), VTUNE(37), CPOUT(38), VDD_PLL(39), REFIN(40), RX2BBIN(41), RX2BBIP(42), RX2BBQN(43), RX2BBQP(44)

87	GND	RF input	Ground
88	GND	Ground	

2   Electrical specifications

2.1 Absolute Maximum Ratings

Stress levels beyond the figures listed below may cause permanent damage to the device.

Parameters	Conditions	Units	Min	Typ	Max
Supply Voltage	Pins to GND	V	-0.2		+4.0
Digital I/O	Pins to GND	V	-0.2		V_{cc}+0.2V
Analog I/O	Pins to GND	V	-0.2		V_{cc}+0.2V
RF Input Power		dBm			+10
Storage Ambient Temperature		ºC	-40		125

Table 2 – Absolute Maximum Ratings

This circuit can be damaged by ESD. It is recommended that you take appropriate precautions when handling all integrated circuits. Failure to observe proper handling procedures may result in ESD damage which ranges from subtle performance degradation to complete device failure. Precision integrated circuits are more susceptible to ESD damage because very small parametric changes can cause the device not to meet its published specifications.

2.2 Operating Conditions[1]

The typical current consumption is based on a typical RFIC at Ta=25ºC

Parameters	Conditions	Units	Min	Typ	Max
Operating, DC Electrical Requirements					
Supply Voltage		V	2.8	3.0	3.6
Current Consumption	Transmit	mA		320	390
	Receive[2]			305	355
	RSSI			50	60
	Standby			50	
	Power-Down			1	

Table 3 - Operating Conditions

2.3 Thermal Conditions

Parameters	Conditions	Units	Min	Typ	Max
Ta	Operating Ambient Temperature[3]	ºC	0		85
Tj	Junction Temperature	ºC	0		125
Θ Ja	Junction-to-ambient Thermal Resistance parameter[4]	ºC/W	15.9		
ΨJt	Junction-to-top-center Thermal Characteristic parameter[5]	ºC/W	0.2		

Table 4 - Thermal Conditions

---

[1] Worst case specifications trough the datasheet are based on the power supply range as described in table 3 and Ta=0 ºC to 85ºC ambient.

[2] Not including RSSI current, which is active only for AGC purpose

[3] Ambient temperature as defined by JESD51-2, is the natural convection air (still air).

[4] Junction to ambient thermal resistance parameter is defined by JESD51-5 using a 76.2x114.3mm PCB, 2ps2, 1.6mm thick.

[5] Thermal characterization parameter as defined by JESD51-2, and can be used to estimate the junction temperature in an actual environment using: $\psi jt = (Tj - Ttop)/P$, Ttop = temperature on top center of the package, P = total power dissipation.

3 Receiver Specifications

Typical conditions (unless otherwise specified): Vcc=3.0v, baseband output signal: 65mV rms OFDM 64QAM, T$_A$=25°.

Parameters Receiver RF Input to	Conditions Baseband I/Q Outputs	Units	Min	Typ	Max
Receive Chains	Full chains, Zero-IF, RF to baseband			3	
RF Input Frequency Range	Full range	GHz		4.9-5.9	
Noise Figure	Max Gain	dB		5.5	
Maximum receive signal	Min Gain, EVM=28dB	dBm		-16	
Ultimate EVM	With Optimal Gain Setting and I/Q mismatch calibration	dB		-34.5	-33

Table 5 - Receiver Specifications

4 Transmitter Specifications

Typical conditions (unless otherwise specified): Vcc=3.0v, ,baseband input signal: 54mV rms OFDM 64QAM, T$_A$=25°.

Parameters	Conditions	Units	Min	Typ	Max
Transmit Chains	Full chains, baseband to RF			2	
RF Output Frequency Range	Full Range	GHz		4.9 to 5.9	
Nominal Output Power	Calibrated	dBm		-5	
Ultimate EVM	At nominal transmit power	dB		-35	-32
TPC Range	For 1dB steps	dB		11	
TPC Step		dB		0.5	1
Output 1dB Compression Point	CW Signal	dBm	4.5	8	

Table 6–Transmitter Specifications

5   Synthesizer Specifications

Typical conditions (unless otherwise specified): Vcc=3.0v, baseband input signal: 65mV rms OFDM 64QAM, T_A=25°.

Parameters	Conditions	Unit	Min	Typ	Max
Frequency Synthesizer and LO Generation					
RF Channel Center Frequency		GHz		4.9 to 5.9	
Frequency raster		MHz	5		20
Integrated Phase Noise	10KHz to 10MHz	°RMS		0.7	

Table 7 - Synthesizer Specifications

Reference Clock					
Reference Input Frequency		MHz		40	
Reference clock input Low level		V_L		0.3	1.2
Reference clock input High level		V_H	2.2	2.2	

Table 8– Reference clock

6   Timing Specifications

Typical conditions (unless otherwise specified): Vcc=3.0v, , baseband input signal: 65mV rms OFDM 64QAM, T_A=25°.

Parameters	Conditions	Unit	Min	Typ	Max
Digital Interface Timing					
Data bus turnaround	Digital Read cycle, Input to Output	ns		2	
	Digital Read cycle, Output to Input	ns		2	
Rise/Fall Time	Digital Read cycle	ns		1	
AGC Timing					
AGC Gain Change	Any gain step	ns		120	
RSSI Response Time	20dB power step, OFDM signal	ns		150	
Mode Switching					
Switching between TX and RX		ns		285	
Switching between RX and TX		ns		285	
Switching between RX Listen and RX		ns		250	
Switching from Standby to RX		ns		375	
Switching from Standby to TX		ns		245	
Switching from RX or TX to Standby		ns		50	
Switching from Power Down to Standby	Includes PLL lock time	µs		350	
Switching from Standby to Power Down		µs		50	

Table 9 - Timing Specifications

7 Theory of operation

7.1 Overview

The MtW8153 consists of three RF receivers and two RF transmitters that support a 2 x 3 MIMO configuration. Designed for scalability, two or more MtW8153 components can be cascaded to establish a higher rank MIMO.

Each receiver and transmitter can work in either the 4.9-5.9 GHz band or in the 2.4-2.5GHz band.

Fast switching between receive and transmit modes, and receiver or transmitter gain control are achieved using a fast parallel interface. The interface is bi-directional to allow both read and write functionality. The RFIC is fully flexible and allows separate controls of each RF chain and the blocks within it.

7.2 Receive Path

Each MtW8153 receive path consists of a programmable-gain LNA, a pair of I & Q demodulating mixers, fully integrated baseband filters, and a set of programmable-gain amplifiers for automatic gain control.

Each receive path has an independent fast-settling gain setting to accommodate MIMO operation with the different input levels received from the antennas. The three receive antennas can also be used to perform maximum ratio combining (MRC), improving performance for modems supporting this functionality.

A base band Received Signal Strength Indication (RSSI) provides wide-band signal detection to the baseband chip, improving interferer rejection. Loopback paths are provided for I/Q calibration of the chip.

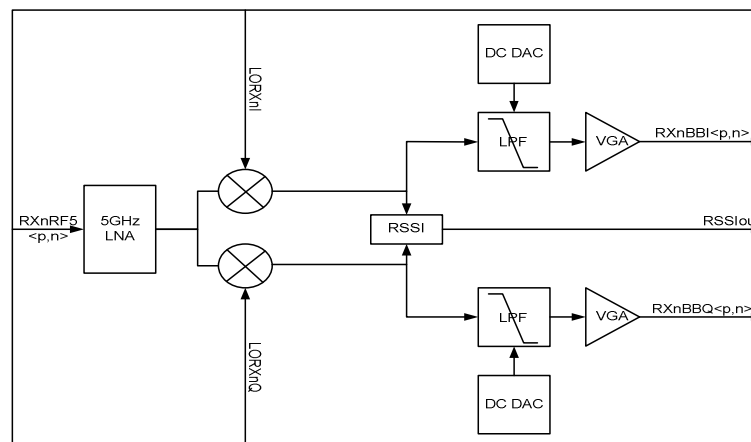

Figure 3 – Receiver block diagram

7.3 Transmit Path

The transmit path includes baseband filters, an I & Q modulator and a programmable-gain power amplifier driver. The baseband filters support both 20MHz channels and 40MHz channel bonding for extended throughput. Superior EVM performance allows support of modulation schemes and MIMO techniques: BPSK, QPSK, 16 QAM and 64QAM OFDM.

Each chain has a separate control of the transmitted power control (TPC) through the parallel interface bus.

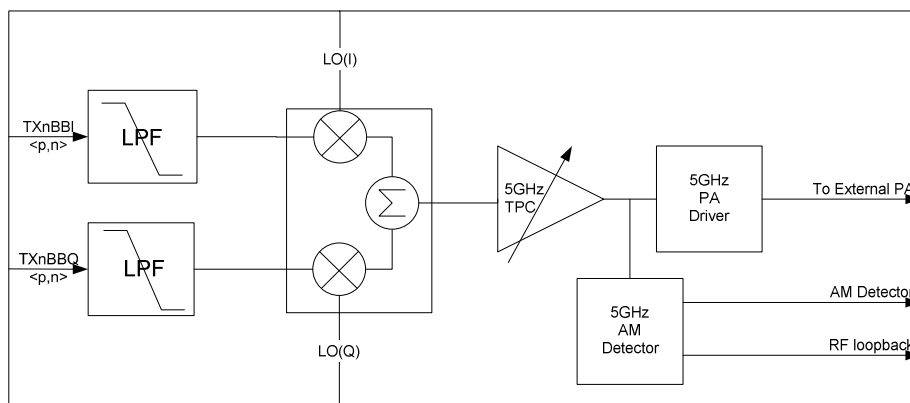

Figure 4 – Transmitter block diagram

7.4 Calibration Circuits

Several calibration circuits are available on-chip, enabling optimum transceiver operation. Imbalance between the I and Q branches is measured and compensated for in a frequency-dependent or constant manner, for each transmitter or receiver.

7.5 Power Modes

Both standby and power-down power-saving modes are available. In power down mode, the MtW8153 is completely shut down except for the digital interface and the reference oscillator. In standby mode, only the on-chip synthesizer is active, enabling minimum power consumption while providing fast response. Transition from this mode to transmit or receive modes takes less than 1µsec.

7.6 Digital Interface

The MtW8153 RFIC employs a parallel interface, which enables fast communication with the chip. This real-time communication is used for fast AGC, TPC, T/R and internal register settings. The interface is asynchronous, with a 6-bit address and 12-bit data bus width. It provides both read and write functionality, at a maximum speed of 60MHz (50ns per access).

The control interface uses nine pins to implement the link:

- Six bi-directional Address/Data bits (DATA0 to DATA5)
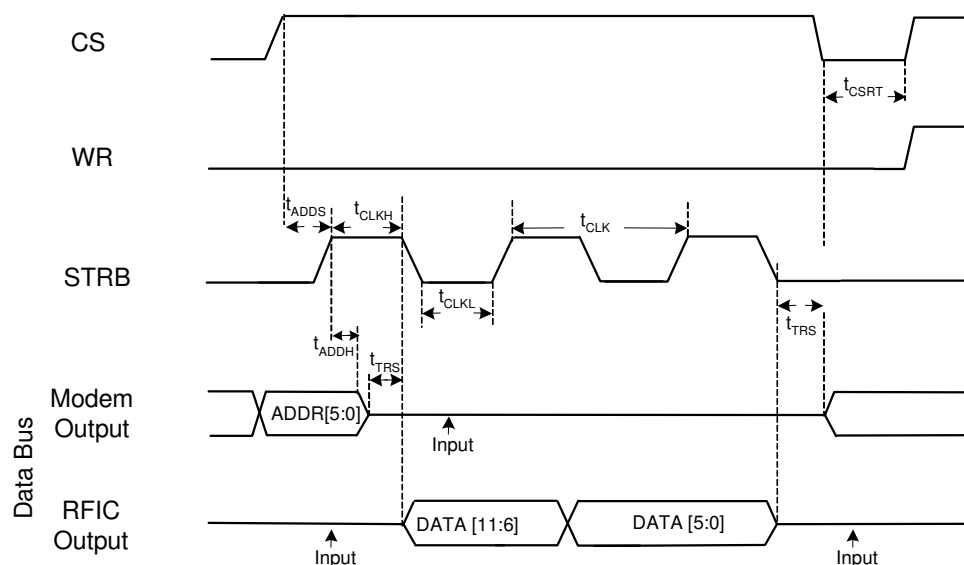

- One Write/Read Signal (WR)

- One Interface Strobe (STRB)

- One Chip Select/Enable masking control (CS)

To ensure synchronicity, CS must remain at logical '0' for a duration of 8ns between digital accesses (read or write) to the same RFIC. Multiple RFICs can be controlled using the same bus, requiring only a separate CS line to select the destination RFIC.

A "burst mode" is available for faster control of sets of registers. This feature can be used for fast setting of the gain registers.

7.6.1 Write Cycle Timing and Operation

Figure 5 - Digital Interface Write Cycle Timing

7.6.2 Read Cycle Timing and Operation

Figure 6 - Digital Interface Read Cycle Timing

In order to prevent collisions, a minimum gap of 4ns is required before the STRB transition to '0', in which the Modem IC must set the data bus I/O pins to their input state.

7.6.3 Digital Interface Timing constraints

Designator	Parameter	Unit	Min	Typ	Max
Read/Write Access Cycle					
t$_{CLK}$	STRB Cycle Period	ns	16.6		
t$_{CLKL}$	STRB 'Low' Time	ns	7.5		
t$_{CLKH}$	STRB 'High' Time	ns	7.5		
t$_{ADDS}$	Address Setup Time	ns	4.0		
t$_{ADDH}$	Address Hold Time	ns	4.0		
t$_{DTS}$	Data Setup Time	ns	4.0		
t$_{DTH}$	Data Hold Time	ns	4.0		
t$_{CSRT}$	CS Access Recovery Time	ns	8.0		
t$_{TRS}$	Collision Avoidance time	ns	4.0
